

## Enhance security through an Identity and Access JumpStart from Insight

### Improve security access and policies.

With users accessing corporate data from more locations and devices than ever before, effective security strategies look vastly different today than they did five years ago. In our cloud-first, mobile-first world, multifactor authentication and conditional access are the most effective controls to insulate your organization against cyberthreats. When correctly deployed, these solutions prevent threats from gaining a foothold in your organization, even if credentials become compromised. Organizations are finding that Microsoft® Azure® Active Directory® is a key tool for enhancing security and simplifying access, on a single identity platform.

In an Identity and Access JumpStart from Insight, our experts walk you through Microsoft security and identity capabilities within Azure Active Directory — and how you can build a secure environment that's ready to use.

### What is a JumpStart?

Insight JumpStart sessions are expert-led workshops that combine training and implementation. Centered around best practices for cloud and security, a JumpStart familiarizes your team with new technology and provides a working environment you can begin using right away.

### How does the JumpStart work?

1. Our Microsoft experts educate your organization on the features and functionality of Azure Active Directory Premium.
2. Through whiteboarding sessions, we design your multifactor authentication and conditional access policies optimized for your business needs and objectives.
3. We build and implement a working environment for three test groups within your organization. This includes:

Establishing a security group of administrators

Configuring multifactor authentication

Creating a security group for hourly workers and restricted access with on-premises access only

Creating a security group for anytime access with Office 365® from anywhere using multifactor authentication

### The result

Your team will leave the JumpStart with new skills and confidence, and a secure working environment of Azure Active Directory.

### Establish strong security practices.

Today's threatscape is active and ever-evolving. Microsoft reports more than 300 million fraudulent sign-in attempts each day.<sup>1</sup>

But, they also state that multifactor authentication can prevent 99.9% of these types of account attacks.<sup>1</sup> Partnering with a team like Insight can give you direct access to the security expertise you need to protect your cloud and multiplatform environments.

Let us show you how to develop and configure policies, use multifactor authentication effectively and take a security-first mindset as you grow.
